Molykote® Is Smart Lubrication™

With innovative thinking, unmatched expertise, global resources and local support, Dow Corning is helping the world’s automotive industry solve or prevent lubrication problems with Molykote® brand lubricants. A complete line of Molykote products and services meets tough lubrication challenges and delivers trusted performance in a wide range of automotive applications. We have Smart Lubrication™ solutions for manufacturing and maintenance, component design and vehicle service. Our experts can help you find new ways to add value and reduce costs: Start with Molykote Anti-Friction Coatings.

Cover: Various metal fasteners, gear couplings and underhood linkages are provided anti-seizing, lifetime lubrication with a wide choice of Molykote Anti-Friction Coatings.
Advantages of Anti-Friction Coatings

Molykote Anti-Friction Coatings are bonded, dry-film lubricants that provide superior lubrication in harsh operating conditions and environmental extremes. They are economical to apply, long lasting and valued in uses where other lubricants fail. Compared to typical lubricating pastes and greases, Molykote Anti-Friction Coatings have a number of advantages. They provide:

- Dry, clean lubrication unaffected by dust, dirt and moisture;
- Lifetime lubrication without aging, evaporation or oxidation;
- Rust prevention without surface treatments like galvanizing;
- Nonflammable, non-staining protection on metals and plastics;
- Controlled film thickness for exact load-bearing capabilities; and,
- Fully effective lubrication even after prolonged shutdown.

How Anti-Friction Coatings Work

Molykote Anti-Friction Coatings have solid lubricant particles dispersed in carefully selected blends of resin and solvents. The volume concentration of lubricants and choice of raw materials are important for the lubricating and corrosion-protection properties. Once applied to a metal or plastic, these paint-like solutions bond to the coated surface and provide a slippery lubricating film that is dry and clean. The film covers all surface roughness and optimizes metal-to-metal, metal-to-plastic or plastic-to-plastic friction even under extreme loads and working conditions.
Selection of Anti-Friction Coatings

Molykote Anti-Friction Coatings typically contain MoS₂ (molybdenum disulfide), graphite or PTFE lubricating solids. Depending on your lubrication need, precise formulations can be engineered with these or other lubricating solids to provide customized options that meet your exact requirements.

Product selection depends on service requirements, the desired coating method and specific advantages for different applications. From selecting the right formulation for your application needs to identifying the proper coating methods, you can rely on Molykote experts for help.

The Coating Process

To ensure the effectiveness and full service life of Molykote Anti-Friction Coatings, a proper coating process must be followed. Surface pretreatment is important. Depending on the material, this involves degreasing, sandblasting, phosphating, anodizing, acid washing or other type of surface pretreatment.

Once the pretreated parts materials dry, various methods can be used to apply an anti-friction coating. Following application, the coating requires drying and curing to bind the lubricating solids to the parts. This can vary from as little as three minutes with air drying to as long as one hour with oven curing.

Selection Guide for Molykote Anti-Friction Coatings compares results achieved with different coating methods.

Key steps for using anti-friction coatings include parts cleaning (pretreatment), drying, applying the coating and heat or room-temperature curing.

### Coating Methods

- **Spraying**: Hand or drum spraying, dipping, centrifuging (dip-spinning), brushing, roll coating and printing.
- **Drying**: Air drying, water base.

### Advantages

- **Low friction**
- **Fuel and oil resistance**
- **Corrosion protection**
- **Chemical resistance**
- **Suitable for high-temperature use**

### Applications

- **Pistons**, **hydraulic parts**
- **Slides, nuts and bolts**
- **Gaskets**
- **Slides, gaskets, cold fogging**
- **Nuts and bolts, weapons, ammunition, constricting components**
- **Pistons, hydraulic parts**
- **Gears, shafts**
- **Noise prevention for interior parts**

---

**Choice of Application Methods**

Molykote Anti-Friction Coatings can be economically applied by hand or drum spraying, dipping, centrifuging (dip-spinning), brushing, roll coating and printing. The size, shape, weight and quantity of the parts being coated are factors in selecting a certain application method. Film-thickness and sliding-surface requirements are other factors.

Different application methods provide excellent, good or limited results, depending on the Molykote product, as shown in the Selection Guide. Each method has certain selection parameters, advantages and disadvantages, as shown in the Coating Methods Comparison Chart. Our application specialists can help you make the right choice.

Application Engineering

Dow Corning offers more than just materials. Molykote application facilities, our Lubricants Expertise Centers, are an especially strong asset of our technology leadership. These dedicated laboratories are equipped with the most common application machines and staffed with coating experts. These centers can produce coated samples, optimizing the coating effectiveness from prototype to production, for the exact Smart Lubrication solutions you need. Our customer support and consulting services can also provide you with coating-line designs, process improvement ideas and coating-shop recommendations.

Anti-friction coatings on pistons and piston rings can reduce noise and scuffing, while increasing combustion efficiency and fuel economy. Typical products include Molykote D-10, PA-744, 7409 and D-88 Anti-Friction Coatings, applied by spraying or printing.

A Molykote lubrication engineer checks curing of coated parts in Dow Corning’s Anti-Friction Coating lab in Songjiang, China.
**Wide Application Range**

As fail-safe lubricants valued by the world’s leading vehicle manufacturers, Molykote Anti-Friction Coatings are widely used in automotive applications to increase:

- **Driving comfort** by reducing noise and vibration;
- **Performance** by providing long-term lubrication;
- **Safety** by keeping inaccessible parts working; and
- **Reliability** by withstanding harsh operating conditions.

Molykote Anti-Friction Coatings are especially trusted for uses where maximum wear endurance is needed and where other types of lubricants cannot be applied. For adding lifetime lubrication to body and interior parts, cutting engine friction losses, or achieving as-designed performance from vehicle operating systems, Molykote expertise can meet your Smart Lubrication™ needs – exactly!

**Molykote 7409 Anti-Friction Coating** provides clean, low-friction lubrication under high loads for seat belt and seat frame guide tracks.

**Molykote 7620**, roll-coated on exhaust manifold gaskets, eliminates stick-slip between dissimilar metal parts and improves sealing properties.

**Molykote 7620, roll-coated on exhaust manifold gaskets, eliminates stick-slip between dissimilar metal parts and improves sealing properties.**

**Lock-catching plates and locking levers** are given long-term lubrication and corrosion protection by dip-spinning them in Molykote 3400A or D-708 Anti-Friction Coating.

**Lock-catching plates and locking levers are given long-term lubrication and corrosion protection by dip-spinning them in Molykote 3400A or D-708 Anti-Friction Coating.**

**Molykote D-96**, when used as a replacement for non-woven tape, eliminates squeaks and rattles in door trim assemblies.

**Molykote D-96, when used as a replacement for non-woven tape, eliminates squeaks and rattles in door trim assemblies.**

**Molykote D-708 eliminates stick-slip and objectionable noise in interior components in which metal-to-plastic squeaks are a problem.**

**Molykote D-708 eliminates stick-slip and objectionable noise in interior components in which metal-to-plastic squeaks are a problem.**

**Long-term lubrication and corrosion protection** can be applied to body components and bolts & nuts by dip-spinning them in Molykote 3400A or D-708.

**Long-term lubrication and corrosion protection can be applied to body components and bolts & nuts by dip-spinning them in Molykote 3400A or D-708.**
Global Lubricants Expertise

Dow Corning has Lubricants Expertise Centers, strategically located worldwide, to provide you with expert technical service and support. In addition to Molykote® Anti-Friction Coatings, our other Smart Lubrication™ solutions for automotive applications include multipurpose oils, synthetic and ultra-high-purity mineral oil fluids, specialty compounds, greases, pastes and more.

Molykote Smart Lubrication solutions are available through a distributor network of more than 3,000 channel partners worldwide. To learn more about our extensive product and service offering, please visit www.molykote.com or email industrial@dowcorning.com.
